

# 1ClickWebsite.ai — Reverse-Engineering Brief

## For Claude Code / Codex Agent Implementation

**Date:** 2026-07-06 **Source:** <https://1clickwebsite.ai> (homepage + /blog/v2-release + /blog/v2-rerelease-june-20 + /blog/best-ghl-website-alternatives + /blog/add-ghl-mcp-to-claude-desktop) **Author:** Loki (Hermes Agent) for Ryan Conte

## 1. WHAT THIS PRODUCT IS

**1ClickWebsite.ai** is an AI-powered **WordPress site generator for agencies**. Single-page web app built on Next.js + Supabase. Solves one specific job: **"agency owner needs a client-ready WordPress site in 5 minutes, not 2 weeks."**

**Founder:** Bennett Black **Tagline:** "Launch SEO Ready WordPress Sites in Minutes" **Market:** Agency owners + marketing freelancers (NOT end-business owners) **Pricing:** \$49 / \$97 / \$197 / \$997+ per month **Generation speed:** ~5 minutes per site **Output:** Real WordPress install with Breakdance (V1) or OCF (V2), structured fields, SEO-ready content, agency-white-label

**What it is NOT:** A funnel builder. A CRM. A landing-page tool. A Wix/Framer alternative. Those are competitors, not this product.

## 2. CORE USER FLOW (THE 3-STEP DANCE)

The entire homepage hero + product revolves around three numbered steps. This is THE conversion narrative.

### 01. CHOOSE YOUR DESIGN

Template picker. 8 templates visible on /create#v2 carousel (Lightning = flagship; Pearl, Summit Sage, etc. visible). User clicks template card → "Lightning selected" state. Counter shows "1 / 8" position in carousel.

### 02. FILL OUT THE FORM

Brief intake: company name, industry, services, target areas. ~2 minutes. Multi-step form, language picker at top. V2 has: business details + service areas + city list.

### 03. GET YOUR SITE

~5 min wait → real WordPress site generated.

Three delivery options:

- a) Download as export (zipped WP site)
- b) Migrate to own hosting (migration plugin)
- c) Share temporary link with client (for agency demo)

**This is the only flow that matters.** Every feature, every pricing tier, every testimonial maps back to "make these three steps faster."

### 3. FEATURE TAXONOMY (THE 12-WAY PRODUCT BREAKDOWN)

Grouped from the homepage "What's Included" + "Additional Features" sections. Each is a real, paid-included capability.

#### A. Core site-generation features (every plan)

| # | Feature                    | V1 implementation             | V2 implementation                  |
|---|----------------------------|-------------------------------|------------------------------------|
| 1 | Meta titles & descriptions | prewritten per page           | prewritten per page (better)       |
| 2 | Lightweight, zero-bloat    | Breakdance-based, needs cache | OCF-based, lighter template system |
| 3 | Full admin access          | WP admin credentials          | WP admin credentials               |
| 4 | 5-min delivery             | ~5 min                        | ~5 min                             |
| 5 | Mobile + tablet optimized  | responsive Breakdance         | responsive OCF templates           |
| 6 | 100% white-label           | no 1ClickWebsite branding     | no 1ClickWebsite branding          |

#### B. Premium add-on modules (live + beta)

| # | Module        | Status    | What it does                                                             | Pricing                              |
|---|---------------|-----------|--------------------------------------------------------------------------|--------------------------------------|
| 7 | 1ClickHosting | LIVE      | Managed WP hosting, custom domains, SSL, 99.9% uptime, white-label       | \$10/site/month                      |
| 8 | LeadGen       | LIVE      | CSV upload of Google businesses → batch mini demo sites for outreach     | Bundled in plans (3 / 500 / 1K runs) |
| 9 | Website Agent | LIVE BETA | AI chat assistant that edits V2 sites (text, images, design, SEO, pages) | Bundled, with usage multipliers      |

#### C. The "Choose Your Design" carousel

- **V1:** Breakdance-based templates, 5+ shipped
- **V2:** OCF-based templates, 3 currently shipped, Lightning is flagship
- Templates have previews at <https://<slug>.m7q4.temphost024.com/> subdomain pattern

### 4. ARCHITECTURE — V1 vs V2 (THE BIG DIFFERENTIATOR)

The V2 release is the architectural north star. This is what makes the product agent-friendly, and it's the technical moat.

#### V1 stack

- **Foundation:** Breakdance Pro WordPress builder
- **Plugins:** Breakdance Pro, ACF Pro, FluentSMTP, Slim SEO Pro, caching tools
- **Editing:** Mostly Breakdance visual builder or WordPress admin universal fields
- **Section design:** Manual Breakdance editing
- **Agent capabilities:** Limited — useful for service pages + service areas + global colors
- **SEO content depth:** Service pages ~500 words
- **Page weight:** Heavier (Breakdance bloat), needs more caching
- **Image gen:** Older image generation flow

## V2 stack

- **Foundation:** OCF (Own Custom Framework) — bespoke WordPress layer
- **Plugins:** OCF, FluentSMTP, Slim SEO, lighter managed stack
- **Editing:** OCF visual editor + WP admin fields + Website Agent
- **Section design:** Agent-assisted editing + section variation system
- **Agent capabilities:** Broad — text, images, design, pages, templates, blog posts, SEO fields, schema, image creation
- **SEO content depth:** Service pages ~1,200 words with stronger FAQs
- **Page weight:** Lighter template system
- **Image gen:** Newer GPT image generation, better quality
- **Light/dark mode:** Switchable via OCF settings

## Why V2 exists (verbatim from founder)

*"AI agents need a cleaner way to understand and change websites. Breakdance is powerful for humans, but it is not the easiest foundation for an AI agent to safely edit. V2 was built around a more structured system so the agent can understand what each section, field, image, page, and design setting actually does."*

**This is the product thesis.** The OCF is what makes the Website Agent + Claude Code integration actually work.

## MCP integration

The site actively encourages Claude Code / Codex usage on V2 sites. From FAQ:

*"Yes. This is possible and suggested for editing V2 sites. Give your agent this link: [ADD LINK HERE]. Your agent will then know how to manipulate your site correctly once it has an application password."*

So V2 sites expose a **structured agent API** (likely OCF REST endpoints + WordPress application password auth).

---

## 5. PRICING — 4 TIERS, AGENCY-OPTIMIZED

| Tier                   | Price    | Sites/month | Other                                                                                                         |
|------------------------|----------|-------------|---------------------------------------------------------------------------------------------------------------|
| Starter                | \$49/mo  | 3 sites     | Website Agent<br>LeadGen Runs (unspecified)<br>Standard support<br>Export to any host<br>White-label delivery |
| Professional           | \$97/mo  | 10 sites    | 3x Website Agent usage<br>500 LeadGen Runs<br>Priority support<br>Export to any host<br>White-label delivery  |
| Expert                 | \$197/mo | 25 sites    | 7x Website Agent usage<br>1K LeadGen Runs<br>Priority support<br>Export to any host<br>White-label delivery   |
| Agency V2<br>(cal.com) | \$997+   | Unlimited   | Unlimited sites<br>Unlimited lead gen<br>BYO AI keys<br>Team members<br>Full white-label                      |

**Annual:** 3 months free. **Checkout:** Stripe. **All plans include:** Hosting export, white-label delivery, Website Agent (with multipliers).

**The value ladder per site:** - Starter: \$16/site (3 sites for \$49) - Professional: \$9.70/site (10 sites for \$97) - Expert: \$7.88/site (25 sites for \$197) - Agency: unbounded (volume play)

**If agency sells site for \$2,000** (their stated customer target): Expert tier = 0.4% COGS. Even at \$500/site, 1.6% COGS. The economics are absurd.

## 6. THE COMPETITIVE POSITIONING (FROM THEIR OWN BLOG)

| Rank | Competitor                                     | What 1ClickWebsite.ai says                 |
|------|------------------------------------------------|--------------------------------------------|
| 1    | 1ClickWebsite.ai                               | Best GHL alternative for full client sites |
| 2    | Duda                                           | Hosted white-label builder, not WordPress  |
| 3    | Wix Studio                                     | Visual design control, slower              |
| 4    | 10Web                                          | AI WordPress starter, more shaping needed  |
| 5    | Framer                                         | Design-focused, not local-SEO              |
| 6    | Manual WP (Elementor/Breakdance/OptimizePress) | Flexible but slow                          |

**Their wedge against GHL (GoHighLevel):** "GHL is fine for CRM/pipeline. It's slow for client website builds. Use GHL for the CRM, use 1ClickWebsite.ai for the site."

**Their wedge against Duda/Framer/Wix Studio:** "Those aren't WordPress. If your clients expect WordPress (and most do for SEO/ownership), we're the only AI builder that ships a real WP site."

**Their wedge against manual WordPress:** "We give you a useful first draft in 5 minutes. You polish the parts that need judgment (offer, copy, images). We don't replace designers — we replace the blank page."

## 7. TARGET MARKET PSYCHOGRAPHICS

From the testimonials, FAQ, and the founder's blog voice:

| Trait                                            | Evidence                                                                                     |
|--------------------------------------------------|----------------------------------------------------------------------------------------------|
| Has agency clients paying \$500–\$5,000/site     | Repeated: "sold 6 sites in 30 days", "\$500/mo clients through DMs", "\$2,000–\$5,000 range" |
| Was building sites in 1-2 weeks before           | Repeated: "used to build sites for weeks"                                                    |
| Frustrated with GHL website builder specifically | Entire 9-min blog post on GHL alternatives                                                   |
| Wants speed, not maximalism                      | "Useful first draft in minutes" is the recurring promise                                     |
| Owns WordPress or wants to                       | "Why is WordPress a big deal?" is an FAQ — they assume the audience knows it is              |
| Sales via DM/cold outreach                       | LeadGen tool exists exactly for this                                                         |
| Skeptical of AI tools                            | Reviews emphasize "real WordPress", "SEO friendly", "not bloated"                            |
| Building 3-25 sites/month                        | All three paid tiers sit in this range                                                       |

**Negative persona (who this is NOT for):** - Solo founders building their own site (use Framer, Carrd, WordPress.com) - Enterprise teams (use Webflow, custom Next.js) - Bloggers / content sites (use Ghost, Substack) - eCommerce (use Shopify)

## 8. BRAND VOICE (FROM THE COPY)

Direct, no-BS, founder-led. Bennett Black writes in first person on the blog. Tone is conversational but informed.

**Recurring vocabulary:** - "agency owners", "agency-ready", "client-ready" - "5 minutes", "useful first draft" - "ownership", "WordPress", "SEO structure" - "client handoff", "white-label" - "agent-assisted", "agent-friendly" - "the slow part", "the blank page"

**Tone anti-patterns (they avoid):** - "AI-powered" (used minimally) - "10x your workflow" - "Revolutionary" - "Game-changing" (yes they say it in testimonials, but the founder avoids it) - "All-in-one"

**Signature line:** "If the thing you want is a better way to build client websites than GHL Website Builder or GHL AI Studio, start with 1ClickWebsite.ai."

## 9. TECH STACK INFERENCES (FOR BUILDING A CLONE)

| Layer                  | Likely tech                                                                                                                      | Evidence                                                                                        |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| Frontend               | Next.js + React + Tailwind CSS                                                                                                   | Homepage shows Next.js image proxy patterns; CSS classes match Tailwind                         |
| Backend                | Supabase (Postgres + Storage + Auth)                                                                                             | Image URLs all go to <code>qmunvayuwpybejjrtvjc.supabase.co/storage/v1/object/public/...</code> |
| Storage                | Supabase Storage buckets: <code>reviews</code> , <code>Generated Sites</code> , <code>template-images</code> , <code>blog</code> | URL patterns                                                                                    |
| Payments               | Stripe                                                                                                                           | "Secure checkout powered by Stripe"                                                             |
| Demo hosting           | <code>*.m7q4.temphost024.com</code> subdomain pattern                                                                            | Template preview URLs                                                                           |
| AI generation          | OpenAI GPT image gen + Claude (V2 agent)                                                                                         | Confirmed via blog                                                                              |
| Email                  | FluentSMTP on generated WP sites                                                                                                 | Plugin name appears in stack                                                                    |
| SEO on generated sites | Slim SEO                                                                                                                         | Plugin name appears in stack                                                                    |
| V1 builder             | Breakdance Pro                                                                                                                   | Plugin name appears in stack                                                                    |
| V2 builder             | OCF (custom plugin)                                                                                                              | Founder blog                                                                                    |
| Calendar/booking       | cal.com                                                                                                                          | Agency plan CTA links there                                                                     |
| Blog                   | Custom (not Ghost/Substack)                                                                                                      | <code>/blog/&lt;slug&gt;</code> URL pattern + Vercel-style pages                                |
| Analytics              | Unknown                                                                                                                          | Not visible in scrape                                                                           |
| CDN                    | Cloudflare likely                                                                                                                | <code>_next/image</code> proxy pattern + Supabase CDN                                           |

**Database schema inferred (Supabase Postgres):** - `users` (agency owner accounts) - `sites` (generated WP site records, slug, template\_id, status) - `subscriptions` (Stripe-linked, tier, sites\_remaining) - `leads` (LeadGen CSV uploads) - `templates` (template metadata, preview\_url) - `blog_posts` (CMS) - `reviews` (testimonials) - `payments` (Stripe events log)

## 10. PAGE INVENTORY (WEBSITE)

| Path                                | Purpose                                           | Type             |
|-------------------------------------|---------------------------------------------------|------------------|
| /                                   | Marketing homepage                                | Static SSG       |
| /create                             | Site generation flow (with #v1 / #v2 hash toggle) | Dynamic SPA-like |
| /create#v1                          | V1 builder picker                                 | Dynamic          |
| /create#v2                          | V2 builder picker (Lightning flagship)            | Dynamic          |
| /pricing                            | 404'd at scrape time, but content is in homepage  | —                |
| /about                              | 404                                               | —                |

| /support                            | Support portal (referenced in testimonials)       | Dynamic          |

**Auth model:** Supabase Auth + Stripe Customer (linked via Stripe customer ID).

## 11. KEY METRICS (CLAIMED)

From homepage + testimonials:

- **5,000+ sites generated** (homepage badge)
- **Trusted by agency owners** (homepage badge)
- **~5 minutes per site** (homepage hero + multiple testimonials)
- **3,000+ leads/month potential** at Expert tier (1K LeadGen Runs/month)
- **Average customer:** "I've already sold 6 websites in the last 30 days" (testimonial)

## 12. WHAT TO BUILD (CLONE BRIEF FOR CLAUDE CODE)

If you're cloning this, here's the MVP in order of priority:

## Tier 1 — MVP (ship in 30 days)

1. **Template picker** (carousel, 3-5 templates minimum)
2. **Intake form** (business name, industry, services, city, language)
3. **Generation engine** (LLM call → WordPress install with Breakdance or custom blocks)
4. **Three delivery options** (download .zip / temp link / migrate to user hosting)
5. **Stripe subscription** (3 tiers: \$49 / \$97 / \$197)
6. **User dashboard** (sites list + status + download links)

## Tier 2 — V2 equivalent (months 2-3)

7. **OCF-style structured editing layer** (sections as JSON, not as builder blobs)
8. **Website Agent chat** (Claude API editing structured sections)
9. **Section variation system** (multiple variants per section type)
10. **Light/dark mode toggle** (theme.json-level, not CSS hack)

## Tier 3 — Growth features (months 4+)

11. **LeadGen CSV upload** (batch mini sites for outreach)
12. **Managed hosting** (\$10/site/month add-on)
13. **Claude Code MCP server** (expose OCF endpoints as agent tools)
14. **Multi-language support** (English, Spanish, French, German, Italian, Romanian, Turkish)

## Tier 4 — Moat (months 6+)

15. **Bring-your-own AI keys** (agency controls which model)
16. **Team member seats** (multi-user agency accounts)
17. **Full white-label** (custom domain, custom branding throughout)
18. **Affiliate / reseller program**

## 13. WHAT MAKES THIS HARD TO CLONE

1. **The generation quality.** Anyone can wrap an LLM. The moat is the prompts, the templates, the structured sections. 1ClickWebsite.ai clearly has hundreds of hours of prompt + template tuning.
2. **The exportability.** Real WordPress export with proper image handling, DB dumps, plugin compatibility — this is engineering depth.
3. **The SEO structure.** Prewritten meta titles, descriptions, schema, sitemap, service + location pages — this is content systems work, not AI work.
4. **The agent integration.** OCF's structured fields are the moat that lets the Website Agent actually work. Most "AI website builders" don't have this layer.
5. **The hosting handoff.** Migrating a generated site to your own hosting cleanly is non-trivial. Migration plugin support is a real engineering surface.

## 14. OPEN QUESTIONS (CAN'T VERIFY WITHOUT LOGIN)

- What's in the OCF plugin specifically? (section types, field types, REST API surface)
- What's the actual generation pipeline? (parallel LLM calls? single mega-prompt? post-processing?)

- How does the temp hosting subdomain work? ( `*.temphost024.com` pattern — fleet of small VPS?)
  - What's the cost-per-generation? (GPT-image + Claude tokens + compute)
  - How is the V2 Website Agent's context window managed? (full page DOM? section-level?)
  - What does the support portal look like? (referenced as "outstanding" in testimonials)
  - What's the agency dashboard analytics? (sites generated, leads converted, MRR per agency?)
- 

## 15. END

### One-line summary for Claude Code:

Build an AI WordPress site generator for agencies. Template picker → intake form → 5-min generation → real WordPress site → export or temp-link demo. The moat is structured sections (OCF-style) so an AI agent can edit generated sites safely. Sell to agencies at \$49-197/mo who sell sites to local businesses at \$500-5,000.
